

ABSTRACT OF THE DISCLOSURE

An information-processing device that executes a specific process more frequently than other processes among a variety of processes is provided. The information-processing device includes a first processor capable of executing an instruction set corresponding to the variety of processes, and a second processor capable of executing a portion of or the entire instruction set, the second processor being capable of executing a part of the instruction set corresponding to the specific process more efficiently than the first processor, wherein the second processor executes the specific process whereas the first processor executes the other processes. Accordingly, the information-processing device can execute a variety of instructions efficiently.
